

# Let's see how this works

- Try out some ways to understand specificity
- Place some styles in each of the three possible places
  - inline `<p style="">`
  - `<style>`
  - `<link href="my.css" rel="stylesheet"/>`

## Writing and using style sheets

- Inline (not the best, but sometimes useful/necessary)
- In HTML `<style>` tag
- Included as a `<link/>` or reference to a new file
- Advanced: generated from javascript
